VMMK-3313

15 - 33 GHz Directional Detector in SMT Package

Data Sheet

Description

The VMMK-3313 is a small and easy-to-use, broadband, directional detector operating in various frequency bands from 15 to 33 GHz with typical insertion loss of 0.5 dB. It is housed in the Avago Technologies' industry-leading and revolutionary sub-miniature chip scale package (GaAsCap wafer scale leadless package) which is small and ultra thin yet can be handled and placed with standard 0402 pick and place assembly equipment. The VMMK-3313 provides a wide detecting power level from -5 to +30 dBm with excellent input and output return losses. A typical of 15 dB directivity is provided, and the detector requires only 1.5 V DC biasing with small current drawn of 0.17 mA.

WLP0402, 1 mm x 0.5 mm x 0.25 mm

Pin Connections (Top View)

Note: "T" = Device Code "Y" = Month Code

Features

- 1 x 0.5 mm surface mount package
- Ultrathin (0.25 mm)
- Wide frequency range: 15 to 33 GHz
- Wide dynamic range
- Low Insertion loss
- Directivity: 11-18 dB typ.
- In and output match: 50 ohm

Specifications (24 GHz, Vb = 1.5 V, Zin = Zout = 50 Ω)

- Bias Current: 0.17 mA typical
- Insertion Loss: 0.5 dB
- Detector output offset voltage: 62 mV typical
- Detector Output voltage at +20 dBm: 1070 mV typical

Applications

- Point-to-Point Radio
- Monitoring Power Amplifier Output Power
- Power Control Loop Detector

Attention: Observe precautions for handling electrostatic sensitive devices. ESD Machine Model = 70 V ESD Human Body Model = 350 V Refer to Avago Application Note A004R: Electrostatic Discharge, Damage and Control.

Electrical Specifications

Table 1. Absolute Maximum Rating (1)

Sym	Parameters/Condition	Unit	Absolute Max
Vbias	Bias Voltage (RF Input)	V	2
Ibias	Bias Current	mA	1
P _{in, max}	CW RF Input Power (RF Input) (2)	dBm	+31
Tch	Max Channel Temperature	°C	+150
Tstg	Storage Temperature	°C	+150

Notes

- 1. Operation of this device above any one of these parameters may cause permanent damage
- 2. With the DC (typical bias) and RF applied to the device at board temperature, $Tb = 25^{\circ} C$

Table 2. DC and RF Specifications

 $T_A = 25^{\circ}$ C, Freq = 24 GHz, $V_b = 1.5$ V, $Z_{in} = Z_{out} = 50$ Ω unless otherwise specified

Parameters / Condition	Unit	Min	Typical	Max

Notes

- 1. Measured data obtained from wafer-probing, losses from measurement system de-embedded from final data, Vbias = 1.5 V applied through a broadband bias tee.
- 2. Measured by reversing the detector and applying RF power to the output port. Directivity is defined as the difference in dB between the power applied in the forward direction and the power required in the reverse direction to produce the same Vdet voltage.
- 3. Voffset is measured with RF input power turned off.
- 4. Vdet is measured with +20 dBm RF input power at 22 GHz.

Product Consistency Distribution Charts at 24 GHz, Vbias = 1.5 V

Voffset: Mean = 61 mV, LSL = 45 mV, USL = 75 mV

 $Vdet_On @ Pin = +20 \ dBm: Mean = 1.07 \ V, \ LSL = 0.9 \ V, \ USL = 1.22 \ V$

Notes

Distribution data sample sized is based on at least 36 Kpcs taken from MPV lots.

Future wafers allocated to this product may have nominal values anywhere between the upper and lower limits.

VMMK-3313 Typical Performance

S-parameter data obtained using 300 μ m G-S-G probe substrate; bias was brought in via broadband bias tees. Power vs. Vdet data obtained using CPW PCB (Fig.8). Losses calibrated out to the package reference plane. (T_A = 25° C, Vbias = 1.5 V, Ibias = 0.14 mA, Z_{in} = Z_{out} = 50 Ω unless otherwise specified)

Figure 2. Insertion Loss vs. Frequency

Figure 3. Input Return Loss

Figure 4. Output Return Loss

Figure 5. Pin vs. Vdet Over Temperature at 24 GHz

Figure 6. Pin vs. Vdet Over Vbias at 24 GHz

Typical Scattering Parameters

Data obtained with 300 μm G-S-G probing on 0.016 inch thick PCB substrate, broadband bias tees, losses calibrated out to the package reference plane. $T_A = 25^{\circ}$ C, $Z_{in} = Z_{out} = 50 \Omega$.

VMMK-3313 Biasing Information

Biasing and Operation

The VMMK-3313 is a 3 terminal device consisting of a "through" 50 ohm line connecting directly between the RF Input and RF Output ports and a directional coupler with a full wave detector that provides a DC output proportional to RF power input. As with any high frequency device, good grounding is required on the common port under the device for it to produce low loss in the "through" mode. A suggested PCB layout with appropriate grounding will be cover later in this application section.

With only 3 terminals available, the DC bias and detected voltage are internally DC coupled to the input and output terminals respectively. The key to successful operation of the VMMK-3313 is the use of low loss bias decoupling networks connected to both the RF Input and the RF Output ports. Figure 7 shows a simple biasing circuit.

The bias decoupling networks provide a low loss AC coupled RF path to the device, a means of biasing the device on the input, and a means of extracting the detected voltage on the output of the device. The detector needs 2 DC blocking caps, C1 and C2, on the input and output ports. This can be accomplished by printing coupled lines on the PCB or using SMT capacitors (ATC 600 series) with

Component	Description
C1, C2	0.2 pF to 0.4 pF (ATC 600 or printed coupled lines)
R1	(Vb -1.5) / 0.00014 Ω
R2	10 kΩ
C3, C4	1 pF
R3	External load resistor (optional)

Figure 7. Biasing the VMMK-3313 Detector Module

values chosen for the frequency of operation. All SMT components are recommended to be no larger than 0402 size. Nominal bias voltage of 1.5 V or 0.14 mA is required for proper operation. Biasing on the input is by a way of a large value resistor R1. Its value can be computed using the following equation:

R1 = (Vb - 1.5)/0.00014

where Vb is the supply voltage.

Detected DC voltage is extracted on the output by a way of a large value resistor R2, in the range of $10 \, k\Omega$. Bypassing capacitors C3 and C4 are needed to prevent RF influence on the dc lines. Suggested value for bypass capacitors is 1 pF.

At zero RF input power, and at 1.5 V supply bias, a nominal 63 mV offset voltage appears at the detected output port. The internal output source resistance for the detector is approximately 20 k Ω . Resistor R3 can be used as an external load resistor for the detector. Its value can be optimized for the desired Vout vs. RF input curve.

Figure 8 shows a VMMK-3313 characterization PCB used to obtain the Vdet vs. Input Power characterization data from 15 to 33 GHz. For ease in broadband characterization, two external 45 MHz – 50 GHz Bias Networks (HP 11612B) were used.

Figure 8. VMMK-3313 Characterization Board

S Parameter Measurements

The S-parameters are measured on a 0.016 inch thick RO4003 printed circuit test board, using 300 μm G-S-G (ground signal ground) probes. Coplanar waveguide is used to provide a smooth transition form the probes to the device under test. The presence of the ground plane on top of the test board results in excellent grounding at the device under test. A combination of SOLT (Short – Open – Load – Thru) and TRL (Thru – Reflect – Line) calibration techniques are used to correct for the effects of the test board, resulting in accurate device S parameters.

Package and Assembly Notes

For detailed description of the device package and assembly notes, please refer to Application Note 5378.

ESD Precautions

Note: These devices are ESD sensitive. The following precautions are strongly recommended. Ensure that an ESD approved carrier is used when die are transported from one destination to another. Personal grounding is to be worn at all times when handling these devices. For more detail, refer to Avago Application Note A004R: Electrostatic Discharge Damage and Control.
